# Q1(a) Performing a grid search for the best value of 'c': \* \* optimization finished, #iter = 15220 nu = 0.000126obj = -47.412747, rho = -0.706443 nSV = 222, nBSV = 0Total nSV = 222 Accuracy = 98.5217% (5798/5885) (classification) 7 98.5217 (best c=0.25, rate=98.9295) \* \* optimization finished, #iter = 15220 nu = 0.000063obj = -47.412747, rho = -0.706443 nSV = 222, nBSV = 0Total nSV = 222Accuracy = 98.5217% (5798/5885) (classification) 8 98.5217 (best c=0.25, rate=98.9295) .....\*....\* optimization finished, #iter = 15220 nu = 0.000031obj = -47.412747, rho = -0.706443 nSV = 222, nBSV = 0Total nSV = 222 Accuracy = 98.5217% (5798/5885) (classification) 9 98.5217 (best c=0.25, rate=98.9295) \* \* optimization finished, #iter = 15220 nu = 0.000016obj = -47.412747, rho = -0.706443 nSV = 222, nBSV = 0Total nSV = 222 Accuracy = 98.5217% (5798/5885) (classification) 10 98.5217 (best c=0.25, rate=98.9295) ....\*...\* optimization finished, #iter = 8074 nu = 0.020558obj = -45.260469, rho = -0.719830 nSV = 348, nBSV = 146 Total nSV = 348Accuracy = 99.0683% (1914/1932) (classification)

Parameter C= 0.25 Accuracy = 99.0683

Classwise Accuracy for 6 = 99.2693 Classwise Accuracy for 8 = 98.8706

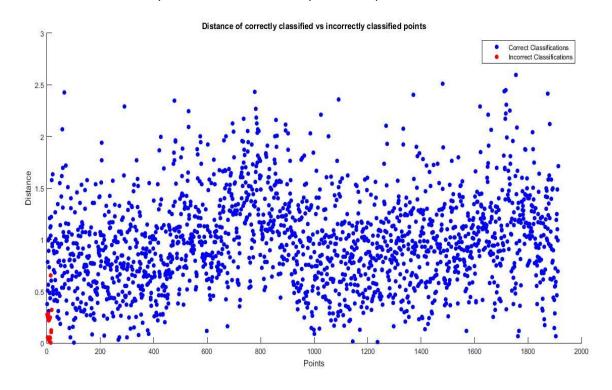

Q1(c) Parameter used and class-wise accuracy on the test set:

Parameter C= 0.25 Accuracy = 99.0683

Classwise Accuracy for 6 = 99.2693 Classwise Accuracy for 8 = 98.8706

Q1(d) Plot of distances of correctly classified and incorrectly classified points

Distances of incorrectly classified points are close to 0 (in the range 0-0.75), whereas those of correctly classified points is much higher (mostly greater than 0.5)

This is expected as, more the distance of a point from the hyperplane, more is the confidence in classification and hence higher accuracy (more it belongs to the certain class). If the point is closer to hyperplane, it is more prone to misclassification

# Q1(e) RBF Kernel, grid search on all parameters to obtain a trained model:

```
*...*
optimization finished, #iter = 11839
nu = 0.249982
obj = -2941.803159, rho = -0.005745
nSV = 5884, nBSV = 0
Total nSV = 5884
Accuracy = 50.2804% (2959/5885) (classification)
2 0 50.2804 (best c=4, g=0.0625, rate=99.6092)
* *
optimization finished, #iter = 11839
nu = 0.249989
obj = -2941.901035, rho = -0.005778
nSV = 5884, nBSV = 0
Total nSV = 5884
Accuracy = 50.2804% (2959/5885) (classification)
2 1 50.2804 (best c=4, g=0.0625, rate=99.6092)
```

#### Final Parameters used and Classwise accuracy

```
....*.*

optimization finished, #iter = 5642

nu = 0.010567

obj = -497.451705, rho = 0.266230

nSV = 3661, nBSV = 0

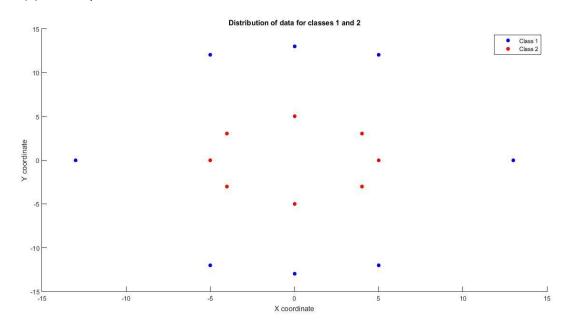

Total nSV = 3661

Accuracy = 99.6377% (1925/1932) (classification)

Parameter C= 4 Parameter G= 0.0625 Accuracy = 99.6377

Classwise Accuracy for 6 = 99.2693 Classwise Accuracy for 8 = 100
```

(a) Plot of points of the 2 classes to show distribution of classes

(b) Yes, it is possible to achieve 100% accuracy on the given dataset with the Kernel – RBF.

**Parameters are:** best c=0.5, g=0.0625, rate=100

**Support Vectors** - 100% accuracy achieved with Kernel RBF with above parameters.

Support vectors are <x,y>:

- 1. 0 13
- 2. 0-13
- 3. 130
- 4. -130
- 5. 05
- 6. 0-5
- 7. -50
- 8. 50

Q2(a) Implemented One-Versus-All multiclass SVM for the entire MNIST dataset (10 classes)

Classification Accuracy is: 98.4%

# **Classwise Accuracy is:**

Class 0: 99.3878%

Class 1:99.2952%

Class 2: 98.2558%

Class 3:98.3168%

Class 4: 98.3707%

Class 5: 98.5426%

Class 6: 99.0605%

Class 7: 97.9572%

Class 8: 98.46% Class 9: 96.333%

Classification is most accurate for classes 0,1,6 and least accurate for 7,9. Thus learnt classifiers predict accurately for 0,1,6 but not that accurately (or distance value from hyperplane is smaller) for 7,9

Q3(a) Using first 200 SPAM, HAM messages for training and rest for testing. Extracted meaningful features – **Most significant words were:** "call", "claim", "free", "get", "just", "now", "reply", "text", "txt"

## Training using Sigmoid Kernel, applying grid search to find best parameters:

```
optimization finished, #iter = 518
nu = 0.253695
obj = -928127.073457, rho = -0.999836
nSV = 108, nBSV = 94
Total nSV = 108
Accuracy = 89.5805% (4634/5173) (classification)
10 0 91.591 (best c=2048, g=0.111111 rate=91.591)

*
optimization finished, #iter = 1352
nu = 0.110942
obj = -98715290.561578, rho = -1.000034
nSV = 584, nBSV = 567
Total nSV = 584
Accuracy = 91.591% (4738/5173) (classification)
```

Parameter c= 2048 Parameter g= 0.11111 Accuracy = 91.591 Classwise Accuracy for ham = 96.4981 Classwise Accuracy for spam = 50.0914

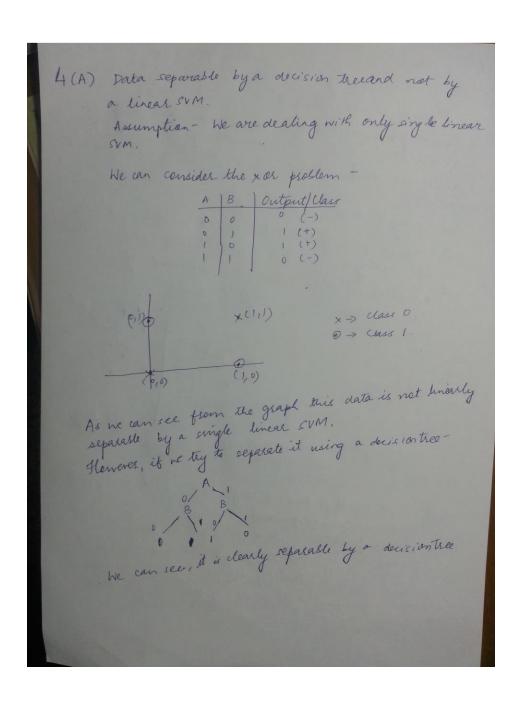

## Parameters chosen after grid search and classiwse accuracy on the test set:

Accuracy = 91.591% (4738/5173) (classification)

Parameter c= 2048 Parameter g= 0.11111 Accuracy = 91.591

Classwise Accuracy for ham = 96.4981 Classwise Accuracy for spam = 50.0914

Q4(a)

for a 2 class problem, beindary of Linear SVM obtained 4(8) c=0 & c= infinity will not be same. There is no such example finding maximal margin corresponds to solving an optimization which involve minimizing the term of 1 11 m1/2 under the constraint that all enemplate are classified Minimizing the term, III WIL+ CEEI She cost or fenalty constant C70 sets occluling importance of maximizing margin & thus generalization performance (small c value) & minimizing amount of classification evers (large c value). Seft Margin Better Generalization as ne > more left to right => Increase Alus, C=00 would produce a single line - hard margin & onisclassifications. whereas Co is going to produce a very vide margin > high misclassification Since C is controlling tradeoff between error & marging in its value, it can never produce width, depending on its value, it can never produce. width, depending on it

```
4(c) K_a(x,y) > 2 ternels K_b(x,y) > 2
                                                            1 Kc(x,y) = Ka(x,y) * Kb(x,y)
                                                                           Kc(xy) is a kernel thence proposed statement
                                                                            is false
                                                                 Mathematical proof:
                                        let da be a feature map for ka, de be a feature map
                                  Ka(x,y) = \text{pater } \text{paly} \text{ } \phi_{a}(x) \text{ , } \phi_{a}(y)
